Time & Frequency Bulletin

No. 377 April 1989 (NISTIR 89-3910-4)

National Institute of Standards & Technology

NIST TIME & FREQUENCY BULLETIN (Supersedes No. 376 March 1989)

NO. 377 APRIL 1989

1.	GENERAL BACKGROUND INFORMATION	
2.	TIME SCALE INFORMATION	
	International Timing Center comparisons via GPS common-view	
3.	UT1 CORRECTIONS AND LEAP SECOND ADJUSTMENTS	
4.	PHASE DEVIATIONS FOR WWVB AND LORAN-C	
5.	GOES TIME CODE INFORMATION	
6.	BROADCAST OUTAGES OVER FIVE MINUTES AND WWVB PHASE PERTURBATIONS	
7.	NOTES ON NIST TIME SCALES AND PRIMARY STANDARDS	
2	SPECTAL ANNOUNCEMENTS	

This bulletin is published monthly. Address correspondence to:

Gwen E. Bennett, Editor Time and Frequency Division National Institute of Standards & Technology 325 Broadway Boulder, CO 80303 (303) 497-3295

NOTE TO SUBSCRIBERS: Please include your address label (or a copy) with any correspondence regarding this bulletin.

1. GENERAL BACKGROUND INFORMATION

ABBREVIATIONS AND ACRONYMS USED IN THIS BULLETIN

APL - John Hopkins University Applied Physics Laboratory

BIH - International Time Bureau, France

CCIR - International Radio Consultative Committee
CRL - Communications Research Laboratories, Japan

Cs - Cesium standard

CSIRO - Commonwealth Scientific and Industrial Research Organization, Australia

GOES - Geostationary Operational Environmental Satellite

GPS - Global Positioning System

IEN - National Institute of Electronics, ItalyINPL - National Physical Laboratory, Israel

LORAN - Long Range Navigation

MC - Master Clock

MJD - Modified Julian Date

NIST - National Institute of Standards & Technology

NPL - National Physical Laboratory, England

NRC - National Research Council, Canada

NOAA - National Oceanic and Atmospheric Administration

OP - Paris Observatory, France

PTB - Physical Technical Federal Laboratory, Germany

SI - International System of Units

SV - Space vehicle
TA - Atomic Time

TAI - International Atomic Time

TAO - Tokyo Astronomical Observatory, Japan

TUG - Technical University of Graz, Austria

USNO - United States Naval Observatory

UTC - Coordinated Universal Time

VLF - very low frequency

VSL - Van Swinden Laboratory, Netherlands

ns - nanosecond

μs - microsecond
ms - millisecond

- second

min - minute

- day

h - hour

The values listed below are based on data from the BIH, the USNO, and the NIST. The UTC - UTC(NIST) values are extrapolations since UTC is computed more than two months after the fact. The UTC(USNO,MC) - UTC(NIST) values are averaged measurements from NAVSTAR satellites 3,4,6, and 8 (see references on page 6).

OOOO HOURS COORDINATED UNIVERSAL TIME

TIME SCALE INFORMATION

1989	ДĹМ	UT1 - UTC(NIST) (± 5 ms)	UTC - UTC(NIST) (± 0.2 µs)	UTC(USNO,MC) - UTC(NIST) (± 0.04 µs)
2	47587	-196 ms	-0.2 µs	0.78 µs
9	47594	-208 ms	-0.2 µs	0.73 µs
16	47601	-220 ms	-0.2 µs	0.69 μ s
23	47608	-232 ms	-0.3 µs	0.66 µs
30	47615	-242 ms	-0.3 μ s	0.64 µs

DITERNATIONAL TIMING CENTER COMPARISONS VIA GPS COMMON-VIEW

The table below is a weighted average of the indicated GPS satellites used as transfer standards to measure the time difference of Timing Center (i) — UTC(NIST) by the simultaneous common-view approach (see references, page 6). The day-to-day variations of this technique are a few nanoseconds and the accuracy is about 10 ns. The time of the measurement is interpolated to 0000 UTC for the particular MJD ending in 9. These data are prepared for the BIPM for the computation on TAI and of UTC. All differential delays are 0 unless otherwise noted.

UTC(i) - UTC		MJD			
UTC(i)	SV NUMBERS	47549	47559	47569	47579

TC(VSL) - UTC(NIST)	9,11,.2	-1301	-1239	-1316	-1352

^{*} This value has been updated from that printed in last month's Bulletin.

3. UT1 CORRECTIONS AND LEAP SECOND ADJUSTMENTS

The master clock pulses used by the WWV, WWVH, WWVB, and GOES time code transmissions are referenced to the UTC(NIST) time scale. Occasionally, I second is added to the UTC time scale. This second is called a leap second. Its purpose is to keep the UTC time scale within ± 0.9 s of the UTI astronomical time scale, which changes slightly due to variations in the rotation of the earth.

Positive leap seconds, beginning at 23 h 59 min 60 s UTC and ending at 0 h 0 min 0 s UTC, were inserted in the UTC timescale on 30 June 1972, 31 December 1972-1979, 30 June 1981-1983, 30 June 1985, and 31 December 1987. When future leap seconds are scheduled, advance notice will be provided in this bulletin.

The use of leap seconds ensures that UT1 - UTC will always be held within ± 0.9 s. The current value of UT1 - UTC is called the DUT1 correction. DUT1 corrections are broadcast by WWV, WWVH, WWVB, and GOES and are printed below. These corrections may be added to received UTC time signals in order to obtain UT1.

DUT1 = UT1 - UTC = -0.1 s beginning 0000 UTC 10 November 1988

^{**} UTC(CSIRO) - UTC(NIST) is computed from the average by CRL, TAO, and WWVH.

^{***} UTC(NRC) - UTC(NIST) has a differential delay of 41.2 ns; all other comparisons are computed using zero (0).

The values for UTC(INPL) - UTC(NIST) were erroneously reported February, 1989. The correct values are -1001613 ns and -1016971 ns for MJD's 47559 and 47569, respectively.

^{= 0.0} s beginning 0000 UTC 25 August 1988

^{= -0.2} s beginning 0000 UTC 19 January 1989

4. PHASE DEVIATIONS FOR WWVB AND LORAN-C

WWVB - The values shown for WWVB are the time difference between the time markers of the UTC(NIST) time scale and the first positive-going zero voltage crossover measured at the transmitting antenna. The uncertainty of the individual measurements is ± 0.5 µs. The values listed are for 1500 UTC.

LORAN-C - The values shown for Loran-C represent the time difference between the UTC(NIST) time pulses and the 1 Hz output of the Loran-C receiver. The stations monitored are Dana, Indiana (8970 M) and Fallon, Nevada (9940 M). The values shown are four-hour averages taken from 1600 to 2000 UTC daily. If data are lost, the symbol (-) is shown in place of the phase value.

MARCH		UTC(NIST) - WWVB(60 kHz)	UTC(NIST) - RECEIVED PHASE (in us)

5. GOES TIME CODE INFORMATION

A. TIME CODE PERFORMANCE (1-31 March 1989)

GOES/East: Performance within normal limits during this period.

GOES/West: Performance within normal limits during this period.

B. SPECIAL REMINDER: Current satellite locations are 65° W. for GOES/East and 135° W. for GOES/West.

C. GOES STATUS REPORTS

A brief message from NIST giving current GOES time code status information is available from the U.S. Naval Observatory's Automated Data Service computer system in Washington, DC. The message may be accessed 24 hours per day without charge by using a variety of terminals operating at 300, 1200, or 2400 Baud and even parity. Two different sets of telephone access numbers are available: (1) for 300 or 1200 Baud and the Bell 103 standard use (202) 653-1079 (commercial), 653-1079 (FTS), or 294-1079 (Autovon); (2) for 1200 or 2400 Baud with either the CCITT V.22 standard or the Bell standard use (202) 653-1783 (commercial), 653-1783 (FTS), or 294-1783 (Autovon). To receive the GOES status message, use the following procedure:

- 1. Access the USNO computer database by dialing one of the appropriate telephone numbers above;
- 2. In response to the prompt for identification, type your name and the name of your organization, followed by a carriage return;
- 3. Type "@NBSGO" followed by a carriage return to receive the status message at your terminal;
- 4. Disconnect by typing Control-D.

6. BROADCAST OUTAGES OVER 5 MIDNUTES AND WAVE PHASE PERTURBATIONS

OUTAGES						PHASE P	ERTURBA:	TIONS WWV	B 60 kF

WWVB	NONE			<u></u>		NONE	 		
WWV	NONE					NONE			
WWVH		47586	0255.30	0301.30	5 MHz	NONE			

7. NOTES ON NIST TIME SCALES AND PRIMARY STANDARDS

The frequencies of the time scales, TA(NIST) and UTC(NIST), are calibrated with the NIST primary frequency standards. The UTC(NIST) scale is coordinated within a microsecond of the internationally coordinated time scale, UTC, generated at the BIH. It is used to control all of the NIST time and frequency services. The last calibration of the relative frequency offset, y, of UTC(NIST) as generated in Boulder, Colorado, gave:

1)
$$y_{UTC(NIST)}$$
 (July 1987) - y_{NBS-6} (July 1987) = (-0.6 ± 2 (1 sigma)) x 10^{-13}

for the date shown. This calibration includes a correction for the systematic offset due to room temperature blackbody radiation, which is approximately (delta y_{BB}) = -1.7 x 10⁻¹⁴. Using GPS¹, the frequency of TAI for the dates shown were measured to be:

2)
$$y_{TAI}$$
 (July 1987) - y_{NBS-6} (July 1987 on geoid) = (+1.7 ± 2 (1 sigma)) x 10^{-13}

where account has been taken of the gravitational "red shift."

Starting 1 January 1975, an accuracy algorithm was implemented to bring the second used in the generation of TA(NIST) closer to the NIST "best estimate" of the SI second (see references, p.6). The relative frequency associated with this "best estimate" is denoted $y_{Cs(NIST)}$. The last calibration (July 1987) covered the period from October 1986 through July 1987.

3)
$$y_{Cs(NIST)} - y_{NBS-6} = (+1.4 \pm 2) \times 10^{-13}$$
 (July 1987) and

4)
$$y_{TAI} - y_{Cs(NIST)}$$
 on geoid = (+0.3 ± 0.7) x 10⁻¹³ (July 1987)

This algorithm should provide nearly optimum accuracy and stability for TA(NIST) since it uses all past frequency calibrations with the NIST primary standards. These calibrations are weighted proportionately to the frequency memory of the clock ensemble that generates atomic time. This algorithm, therefore, capitalizes on a weighted combination of all the frequency calibrations with the primary standards in order to gain a "best estimate" of the SI Second while simultaneously obtaining the best uniformity available from the ensemble of working clocks in the atomic time scale system. The relative frequency of TA(NIST) is steered toward $y_{CS(NIST)}$ by slight frequency drift corrections of the order of 1 part in $10^{13}/yr$.

TA(NIST) and UTC(NIST) are no longer simply related by an equation. TA(NIST) is now computed each month using a Kalman algorithm which minimizes the mean square time dispersion. UTC(NIST) is now independently computed using a different algorithm and is steered in frequency to keep its time within a microsecond of UTC(BIH). Table 7.1 lists monthly values of the time difference between UTC(NIST) and TA(NIST). A linear interpolation between monthly values will typically be within 10 ns of the actual time difference, TA(NIST) — UTC(NIST).

The primary standards of NIST (NBS-4 and NBS-6) are used in either of two modes: as calibrators of frequency to provide a reference for the SI second; or as member clocks of the NIST clock ensemble, to help keep the proper time for TA(NIST) and the coordinated time for UTC(NIST). Operating in the clock mode, NBS-4 and NBS-6 are only used and weighted according to their stability performance. Accuracy enters only when they are used as frequency calibrators, in which case clock operation is necessarily interrupted.

¹GPS is the Global Positioning System, a network of navigation satellites.

Table 7.1 is a list of changes in the time scale frequencies of both TA(NIST) and UTC(NIST) as well as a list of the time and frequency differences between TA(NIST) and UTC(NIST) at the dates of leap seconds, and/or frequency or frequency drift changes.

TABLE 7.1

		F	REQUENCY CHANGE	S	
DATE	(MJD)	TA(NIST)	UTC(NIST)	TA(NIST) - UTC(NIST)	y[UTC(NIST)] - y[TA(NIST)]
1 Oct 87	47069	0	1.25 ns/d	23.045 102 583 s	-3.47 E-13

1 Mar 88	47221	0	-1.25 ns/d	24.045 107 137 s	-3.58 E-13
1 Apr 88	47252	0	-1.50 ns/d	24.045 108 130 s	-3.85 E-13
1 May 88	47282	0	-1.50 ns/d	24.045 109 170 s	-4.29 E-13
1 Jun 88	47313	0	-1.50 ns/d	24.045 110 358 s	-4.47 E-13
1 Jul 88	47343	0	-1.60 ns/d	24.045 111 52 3 s	-4.64 E-13
1 Aug 88	47374	0	-0.40 ns/d	24.045 112 8 02 s	-4.89 E-13
1 Sep 88	47405	0	-1.00 ns/d	24.045 114 144 s	-5.15 E- 13
1 Oct 88	47435	0	1.00 ns/d	24.045 114 515 s	-5.15 E -13
1 Nov 88	47466	0	1.25 ns/d	24.045 116 854 s	-4.88 E -13
1 Dec 88	47496	0	1.50 ns/d	24.045 118 088 s	-4.69 E-13
1 Jan 89	47527	0	1.50 ns/d	24.045 119 325 s	-4.57 E -13
1 Feb 89	47558	0	1.00 ns/d	24.045 120 538 s	-4.51 E-13
1 Mar 89	47586	0	-1.25 ns/d	24.045 121 622 s	-4.58 E-13

UTC(NIST) is steered in time toward UTC by occasional frequency changes of the order of a few nanoseconds per day; 1 ns/d is approximately 1.16E-14. Otherwise, y[UTC(NIST)] is maintained as stable as possible.

8. SPECIAL ANNOUNCEMENTS

43rd Annual Symposium on Frequency Control

The 43rd Annual Symposium on Frequency Control will be held on May 31 - June 2, 1989. The site for this years symposium will be the Marriott Hotel City Center in Denver, Colorado.

The number of summaries submitted to the technical program committee reached an all time high. The quality of these submissions proves to make the 43rd the best symposium ever. Ninety papers will be presented in 21 sessions. Highlights will be a specially organized session on environmental effects and their measurement, a session on surface preparation of quartz, including a tutorial on abrasive processes, and a session on two-way time transfer.

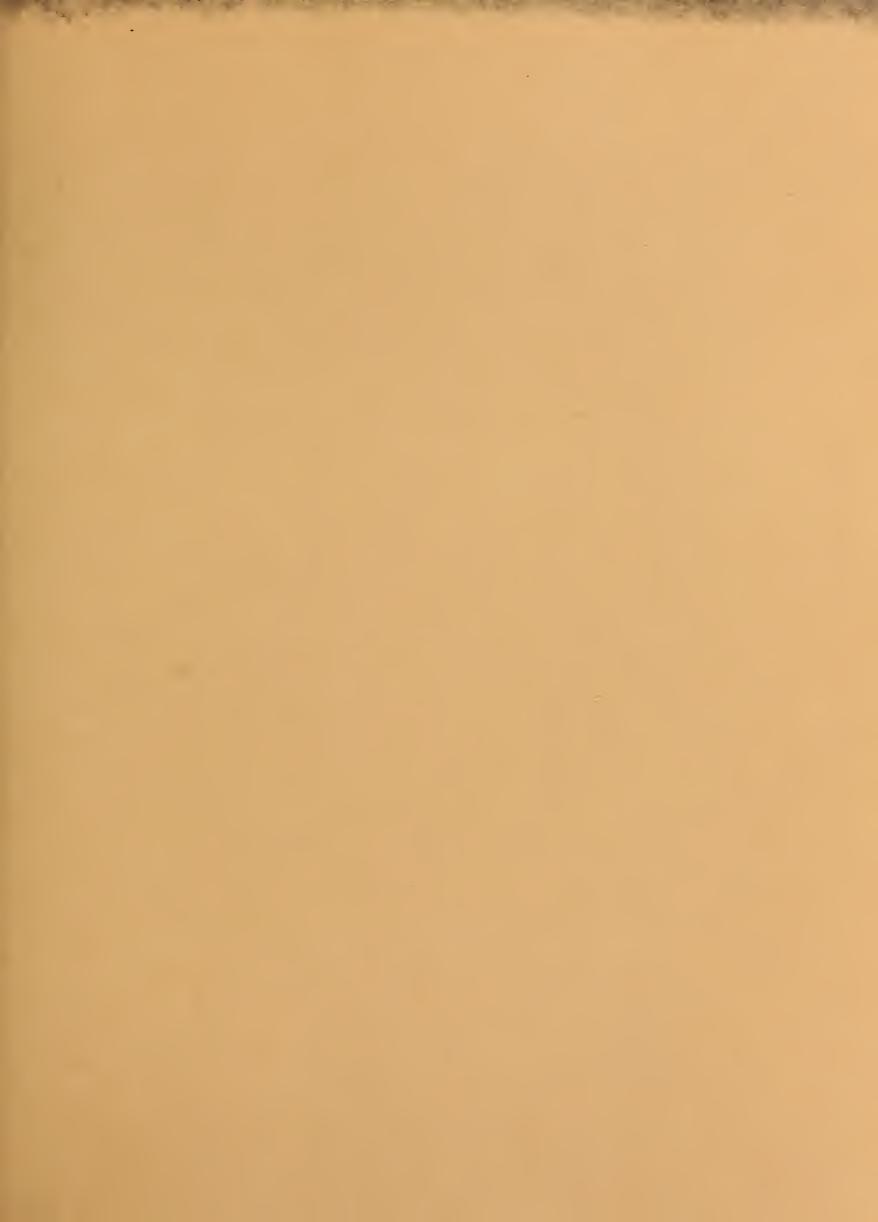

The symposium will begin with a plenary session at which three prestigious awards will be presented. The Cady award is presented annually by the technical program committee to frequency control devices. This year the award recipient will be Dr. D.E. Newell. The Rabi award is presented to recognize outstanding contributions related to fields such as atomic and molecular frequency standards, time transfer, and frequency and time metrology. This year's recipient is Dr. L. Cutler. The third award, sponsored by Sawyer Applied Research Products, is presented in honor of C.B. Sawyer for the most outstanding recent contribution to advancement in the field of quartz crystals and devices. The recipient of the C.B. Sawyer award is selected by an independent committee and will be announced at the symposium.

Special invited presentations will include "Spacecraft Gravitational Wave Experiments" by J.W. Armstrong, JPL; "Shear Mode Grinding" by N.J. Brown and B.A. Fuchs, LLNL; "A High Stability Microwave Oscillator Based on a Sapphire Loaded Superconducting Cavity" by D.G. Blair, A.J. Giles, and S.K. Jones, U. of Western Australia; "Stacked Crystal Filters Implemented with Thin Films" by K.M. Lakin, G.R. Kline, J.T. Martin, and K.T. McCarron, Iowa State U.; and "Low-Cost High-Performance Resonator and Coupled-Resonator Designs: NSPUDT and Other Innovative Structures" by P.V. Wright, RF Monolithics.

The social program will be extra special due to the proximity of the National Institute of Standards and Technology (formerly the National Bureau of Standards). There will be a tour of NIST, including a visit to the nation's time standard, tentatively scheduled for Wednesday evening, May 31. Dinner on Thursday, June 1, will be at a famous Denver attraction The Fort. The Fort is a restaurant specializing in authentic foods of the American West including buffalo, Rocky Mt. oysters and Rocky Mt. trout. This will be an experience to be enjoyed by all.
